Doctors knock out sheep to discover anesthesia's dark side

医生使绵羊昏睡，以了解麻醉技术的阴暗面

knock out: 使失去知觉；使昏昏欲睡

英文释义：to make somebody fall asleep or become unconscious

anesthesia/ˌænəsˈθiːzə/: n. 麻醉

例句：The surgery was carried out under anesthesia.

词性拓展：anesthetic (n. 麻醉药；麻醉剂)

Beneath green surgical sheets and a tangle of tubes, a healthy young ewe is undergoing a heart-lung bypass procedure to help answer one of several urgent questions about a pillar of modern medicine: anesthesia.

在绿色手术巾和一堆乱糟糟的导管之下，一只健康的小母羊正在接受心肺旁路术。麻醉是现代医学的基础，这次手术旨在帮助解答关于麻醉的一个紧迫问题。

Almost two centuries after anesthetics revolutionized surgery, a growing body of research is pointing to disturbing side effects that range from delirium to cancer-proliferating immune suppression. Of the 200 million adults worldwide who undergo non-cardiac surgery annually, more than 1 million will die within 30 days. "You don't die on the table, but quite a lot of you don't get home," said Andrew Davidson from the Murdoch Children's Research Institute in Melbourne.

大约在麻醉剂革新了外科手术的两个世纪后，越来越多的研究指出它存在令人忧心的副作用，其后果轻致谵妄，重致（使癌细胞增殖的）免疫抑制。在全球范围内，每年有 2 亿成年人接受非心脏手术，其中有超过一百万人会于术后 30 天内死亡。来自墨尔本默多克儿童研究所的安德鲁·戴维森说：“病人不会死在手术台上，但很多人都不能活着回到家。”

A paper published last month showed that volatile-gas anesthesia was associated with higher activity in a key nerve that corresponded with a potentially damaging reduction in blood flow to the kidneys of sheep during abdominal surgery. Intravenous anesthesia had less impact.

一篇发表于上个月的论文显示, 在绵羊接受腹部手术期间, 气体吸入式麻醉可能使一种关键神经的活跃度更高, 这又可能导致流向羊肾的血流减少, 而这种减少是有潜在危害的。静脉麻醉的影响则更小。

It's possible that the nerve activation associated with anesthesia, especially the inhaled gas form, is also impairing the immune system, according to Clive May, head of the Florey Institute's preclinical critical care unit.

克莱夫·梅是弗洛里研究所临床前重症监护部的负责人。他说，与麻醉（尤其是气体吸入式麻醉）相关的神经活跃，还可能会损伤免疫系统。

"For 140 years, we were just concerned about safety," Lis Evered, a neuroscientist at St. Vincent's Hospital Melbourne, said. "In the last 30 years, we've actually become a bit more concerned about other sorts of impacts. Now, we want people to survive the procedure and have a good quality of life for the next 10 to 20 years."

墨尔本圣文森特医院的神经科学家丽丝·埃弗雷德说：“140 年来，我们只关心麻醉技术的安全性。在过去的 30 年里，我们其实（比以前）更加关注其他各种各样的影响。现在，我们希望人们撑过手术，并且在未来的 10 到 20 年里有良好的生活质量。”
